I have some bad news for you... and good news for me...

- You are a data hoarder, an addict in fact
- You want to keep everything
- You admit that most of what you want to keep will never be useful
- You want to be even more, not less, of a data hoarder - if only you could afford it
- But you keep data because it might be useful, sometime, maybe, but probably not
- But when you need it, you really need it
- If only you can find the important pieces
- I am here to tell you, store it all, forever!

The data storage industry thanks you...

Capacity read / written over 5 years

This years theme - The big squeeze

- Several facets of IT infrastructure are undergoing a transformation where changes at the extremes are putting immense pressure on the things in the middle
- Transforming:
 - Business models
 - Storage Capacity
 - Enterprise Disk Arrays
 - Servers and Storage

The squeeze – Business Models

Not about technology but technology impact will be significant

- Ten companies will consume 50% of the IT infrastructure
- Herds of engineers writing custom applications for commodity H/W
- Infrastructure being sold at 1/2 of the margin it once sold at
- Revenues decline for the historical system companies
- What's left is under margin pressure due to top 10 cost transparency

Timing	Winners	Losers	Relevance
Now	Component providers and low-cost integrators, volume purchasers	Enterprise IT providers	COTS lower cost but do-it-yourself or work with low-cost integrator

The squeeze – Storage Density

3D NAND and SMR HDD recording technologies squeeze maximum capacity at the expense of maintaining the long standing behavior software expects

3D NAND results in significant increases in solid state storage density, reductions in cost, but with reduced durability and reliability

SMR (shingled magnetic recording) keeps hard disk drive capacities growing - Random read, sequential write and overlapping writes are messy. When I write I might damage data written on previous track

Performance can vary by orders of magnitude – more often

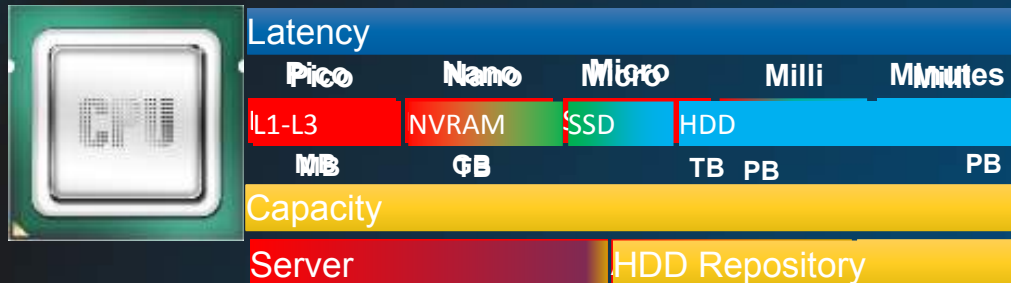

Reliability / integrity can vary by orders of magnitude – over time

Answer – Performance variations more tolerable than any risk of data integrity changing.

Timing	Winners	Losers	Relevance
2015+	Semiconductor Storage, HDD Suppliers	15K RPM Disk Drives	Bigger Fault Zones, Software must tolerate broader range of "normal" behavior

The squeeze – Enterprise Arrays

What if I could keep my entire working data set close to the CPU, shared, available
 What if the rest of my data, including copies, were affordably accessible in milliseconds

New memory Hierarchy enablers:

- Software defined storage for tiering and high availability
- Solid state technology memory alternative
- Low latency commodity interconnects

Timing	Winners	Losers	Relevance
2017+	Semiconductor Storage, Disk Based Cloud Storage	Enterprise Storage Arrays	Higher performance applications, lower cost total storage, industry consolidation

The squeeze – Server and Storage

- What if I could run my application on my disk drive?
- What if I had a server with a petabyte of capacity?
- What is a server and what is storage, does it matter?
- Moving the application to the storage or the storage to the application, a matter of perspective
- Think of it as a platform for dynamically hosting software that is very close to the data with the premise that it is easier to change the software than move the data...
- What could you do with it?

Timing	Winners	Losers	Relevance
Now to 2017	Device manufactures, low-cost integrators	Storage or Server only vendors, network vendors	Applications that can store / analyze locally, network limited environments
